You can get your data from here to there with either integration or automation. But only automation delivers the complete solution for your ServiceNow connectivity needs.

**INTEGRATION** | **AUTOMATION**
---|---
Moves data from a source to a destination | Moves data from a source to a destination
Configuration via code or proprietary tools | Configured via a native ServiceNow application
Only transform data once it’s actually in flight | Transform data securely before it leaves ServiceNow
Database schemas require manual creation | Automatically creates and modifies schema from your ServiceNow fields
At-rest and in-transit encryption may not be supported | Support for encryption both at rest and in-transit
Outages and data losses may not even be detected | Highly available, auditable, real-time data movements
Web services requires exchange of login credentials | “Push” model for ServiceNow means no credential exchange
Limited to the “grab and go” model often used by traditional ETL tools | Allows a true engineering approach to data design
